Amendment to the Specification

In the Specification:

Please amend the specification as follows:

On Page 15, the paragraph beginning at line 23 should be replaced with the following.

When a browser program executed on a client device requests Web page 130 from the Web server, the script code within the requested page 130 makes a function call 132 to a selective display control object 134. Selective display control object 134 contains a control function or control method 136 that controls the Web server side operations. Via a data retrieval operation 138, control method 136 retrieves client request header information 140 and communicates the information through a function call 142 to a browser detection sub-object 144. Browser detection sub-object 144 implements a browser detection method 146 that parses and detects the browser properties from client request header information 140. The browser detection method then relays the browser type and version via a function call return 148 back to control method 136. Control method 136 uses the browser type and version to determine the compatible browser instructions that should be appended to requested Web page 130. Control method 136 makes an appropriate function call 150 or 150', respectively directed to MS Method 152 or Netscape Method 154 (or other), to the appropriate method to retrieve or generate instructions to selectively display additional content in the indicated browser program. The appropriately called method retrieves or generates code compatible with the browser program indicated to be running on the client device. The compatible code is communicated via a function return 156 and added to requested page 130 as browser compatible script 158. The modified page is then communicated back to the browser on the client device over the Internet or other network that connects the server with the client device.
